

Melbourne CityLink, Australia

Since its opening in 1997, Melbourne CityLink has been using Citilog's solutions for Automatic Incident Detection and Traffic Data Collection.

In 2003, additional cameras were added to the system, bringing the total number to 130.

The 2 main tunnels and the access roads are monitored by the system. Any incident and all relevant traffic data are reported to the Central Control Computer System.

The system performances were key choice factors for CityLink and special attention was paid to the detection rate and false alarm rate.

“The system performs as expected and fulfils CityLink requirements for incident detection.”
declared the Principal's Representative when signing the Certificate of Completion.
